

## Test Task

Create an application for a fictional casino company, where the employees can manage which games the users are able to play.

## Task

Create a dashboard page that will be used by the employees. The dashboard should be a single-page application. The following views are required:

1. The main view where all the games are displayed in a grid as cards
2. A view for managing games

The application should be responsive e.g., single column of games in mobile portrait view, single row in mobile landscape view.

It should be possible to add, remove and reorder the games in the grid.

## Suggestions

Login functionality is **not** needed.

We use **React** with **Typescript**, **Redux-Saga** (<https://redux-saga.js.org>) and **Material-UI** (<https://mui.com>) as the main UI library. Try to use all these technologies in your solution.

Unused code should be deleted so that we could focus on functional code.

Feel free to style the application as you see fit, but you will be mainly evaluated on functional code.

## What is mandatory

Test task must include steps to run the application. Include this in the project's README.md file.

Send us the project as a link to your Git repository or as an archive.
